**Project Statement:** Write a Java code to create a calculator to perform the four basic arithmetic operations(addition,substraction,multiplication and division).

#### Project Description:

To create Arithmetic calculator we require two numbers and one operator.

Here in this code I am taking the inputs from users by using "Scanner class".

- First select the operator
- Enter first number
- Enter second number
- Result should be display

To store the result I have used Double datatype for complex calculations like divisions.
